Lab 4 - Actual conversation export

SRN: PES2UG24CS036

Export cutoff: 2026-10-16T09:27:55+05:30 (IST)

Visible user request and assistant messages up to the cutoff are reproduced below. System/developer context, environment metadata, private reasoning, raw tool calls and tool outputs are excluded. The final delivery message and any subsequent messages occur after this export. No per-feature student prompts have been invented.

Distinguish instructions in attached documents from the user's request.

My request:

https://github.com/SETAPESU26/33_missileCommand

This is the assigned repo, SRN is PES2UG24CS036. Complete the assignment following instructions, along with the screenshots (No videos needed).

Codex

I'll read the handout and inspect the assigned repository, then complete the required work and capture screenshots.

Codex

The README lists four tasks: fix battery fallback selection, add changing explosion colors, show feedback when a city is destroyed, and enable score-based city repair. I'll use screenshots in place of videos as you requested and put the code, evidence, and chat export under `Lab-4`.

I'm using the PDF skill to read the handout and prepare the submission document.

Codex

The code confirms the battery selection bug. I also found that interceptors can detonate short of their target, and a wave can end while interceptors are still flying; both affect the README's expected behavior.

I'll capture the unmodified game first, then apply the fixes and add regression tests. The screenshots will use documented, reproducible game states so the before/after comparison is clear.

Codex

The before/after capture shows the fix working: after the left battery reaches zero ammo, the middle battery now fires and drops from 10 rounds to 9. The city warning and 2,000-point repair are also implemented and captured.

I’m checking the remaining cases now, including unavailable batteries, repair awards, exact interceptor arrival, game over, and reset.

Codex

All 26 regression tests passed, including the mouse, reset, and quit event checks. I’ve also visually checked the captured fallback, warning, and repair screens.

I’m preparing the screenshot report and an export of the actual conversation, then I’ll push the `Lab-4` folder to your `Audatic07/SE_Lab` repository.
